

We are pleased to announce that Jason Morehouse has joined the ERLA team.

Prospect, Connecticut native, Jason Morehouse graduated from the University of Connecticut in Spring 2011 with a Bachelor of Science degree in Landscape Architecture. Throughout his college career he worked on a variety of projects that included community outreach where he provided landscape design services to Towns and Municipalities to improve their parks and public spaces. Jason also focused on site design in urban settings. He communicated these designs by constructing abstract models to help observers understand the intent. Jason's curriculum ventured outside the classroom on many projects including his senior year Cap Stone project. He created a vertical farming concept for the island of Nantucket, MA with the intent of supplying the island with fresh fruits and vegetables. These 'farms' would be located on barges they could be moved to various parts of the island as needed.

Prior to joining ERLA, Jason worked with a firm that provided infrastructure mapping for the City of New York. His role made him responsible for projects that included the conversion of all paper drawings of the electric utilities in Manhattan to modern digital file formats. He managed, reviewed and delivered all drawings related to the project.

Jason implemented designs for friends and family throughout his college career. The knowledge he gained honed his skill as he took them through the entire design and construction process. With this background Jason brings technical and construction based knowledge to the ERLA team.
